

One engine, because one object: $P(n, k)$ is a cyclic cover of a two-vertex base

the base $B(1, k, 0)$: two vertices, three edges,
voltages in $\mathbb{Z}_n$

the cover $P(7, 2)$: each base vertex
lifts to a fibre of $n = 7$

$P(5, 2)$: the Petersen graph,
one of the **460**
